

SCREENING FOR MULTIPLE CANCERS IS POSSIBLE WITH GALLERI®

Galleri screens for a signal shared by 50+ types of cancer in one blood draw.

Introducing the Galleri test

The test looks for a signal shared by 50+ cancer types through a simple blood draw (for a list of cancers, visit: [Galleri.com/50-cancers](https://www.galleri.com/50-cancers)).

**of cancer deaths are
caused by cancers not
commonly screened for.**

Only 5 types of cancer have recommended screening tests —colorectal, lung, breast, cervical, and prostate. Adding Galleri multi-cancer early detection test can help find cancer early.

How the Galleri test works

Galleri screens your blood sample for cell-free DNA and identifies whether it comes from healthy or cancer cells. DNA from cancer cells has specific methylation patterns that can identify it as cancer.

Who is Galleri for?

The Galleri test will be offered as a covered benefit to eligible retirees, associates and spouses who are 50 years old or older or 40-49 with elevated risk factors who are enrolled in a Bimbo Bakeries medical plan. It is not recommended if you are pregnant or undergoing active cancer treatment.

Key benefits are

Multi-cancer early detection

Improves your chance to find cancer early. It detects a signal shared by dozens of cancers that don't have screening tests.

Testing with ease

Screen with a simple blood draw easily added to your cancer screening plan.

More information about your health

If a cancer signal is found, the results can predict the tissue or organ associated. This helps your healthcare provider guide the next steps with the cancer signal.

The Galleri test does not detect all cancers and not all cancers can be detected in the blood.

Understanding the results

The Galleri test looks for a signal in your blood that could indicate cancer. **Results are available in about two weeks and there are two possible results:**

⊖ No Cancer Signal Detected

This means that no cancer signal was found in your blood draw. This does not rule out cancer. The Galleri test does not detect all cancers. Continue with routine cancer screening tests your healthcare provider recommends.

⊕ Cancer Signal Detected

This means a cancer signal was detected in your blood draw. This result is not a cancer diagnosis. Your healthcare provider will discuss next steps to confirm if cancer is present.

False positive and false negative results do occur.

Important Safety Information

The Galleri test is recommended for use in adults with an elevated risk for cancer, such as those aged 50 or older. The Galleri test does not detect all cancers and should be used in addition to routine cancer screening tests recommended by a healthcare provider. Galleri is intended to detect cancer signals and predict where in the body the cancer signal is located. Use of Galleri is not recommended in individuals who are pregnant, 21 years old or younger, or undergoing active cancer treatment. Results should be interpreted by a healthcare provider in the context of medical history, clinical signs and symptoms. A test result of "No Cancer Signal Detected" does not rule out cancer. A test result of "Cancer Signal Detected" requires confirmatory diagnostic evaluation by medically established procedures (e.g. imaging) to confirm cancer. If cancer is not confirmed with further testing, it could mean that cancer is not present or testing was insufficient to detect cancer, including due to the cancer being located in a different part of the body. False-positive (a cancer signal detected when cancer is not present) and false-negative (a cancer signal not detected when cancer is present) test results do occur. Rx only.

Laboratory / Test Information

GRAIL's clinical laboratory is certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA) and accredited by the College of American Pathologists (CAP). The Galleri test was developed, and its performance characteristics were determined by GRAIL. The Galleri test has not been cleared or approved by the Food and Drug Administration. GRAIL's clinical laboratory is regulated under CLIA to perform high-complexity testing. The Galleri test is intended for clinical purposes.
